2859. ATOMIC SELF-CONSISTENT FIELD EQUATIONS. 530.153

A.S. Kompaneets and E.S. Pavlovskii.

Zh. eksper. teor. Fiz., Vol. 31, No. 3(9), 427-38 (1956). In Russian.  
The Thomas-Fermi equation for the potential in an atom has been obtained together with all of the corrections of the order  $Z^{-2/3}$  ( $Z$  = atomic number of the element) on basis of the Fock self-consistent field method. It is shown that the correction previously proposed by Weizsäcker is 9 times too large. The exchange correction previously found by Dirac is valid only as long as it is small compared with the main term in the potential.

Abstract: speed of growth (Norway maple, red-leaved ash).  
In the first case, the accompanying species do not usually leave the oak behind, or outstrip it very inconsiderably, or even slightly fall behind it in growth, in the 10-11 year age. In the presence of a combination of slowly-growing accompanying species, and with such quick-growing second-growth species as birch, ash-leaved maple, and poplar, the fellings for thinnage begin at the age of about 10 years and are applied exclusively to the second growth. In the second case, the accompanying ones from the very beginning leave the oak behind and, found between rows of quick-growing temporary species

TITLE:

The Quantum-mechanical Calculation of Pressure in Solids

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 38, No. 4, pp. 1176 - 1182

TEXT: One of the main problems in solid state physics is the calculation of the cohesion energy in the normal state as well as the determination of the compressibility curves, i.e. the density-pressure-function. The quantum-theoretical method of calculating temperature and pressure not only furnishes equally good results as other methods (e.g. the Thomas-Fermi method), but, beyond that, it is characterized by a number of particular features which are due to the reconstruction of the atomic electron shells in compression. An investigation of pressure in a solid by quantum-mechanical means is very complicated, which is, above all, due to the fact that the system is not a close one. Pressure might be expressed by the quantum-mechanical stress-tensor, which, however, leads to difficulties because of the necessity of taking the electromagnetic

tensor into account. Thus, the quantum-mechanical pressure formula is not derived via the stress tensor, but is obtained as a generalization of the virial theorem. This formula (10) is applied to the model of the spherical cells of Wigner-Seitz and its application is discussed in great detail. The authors finally thank Ya. B. Zel'dovich, N. A. Dmitriyev, and V. N. Mokhov for advice and discussions. V. A. Fok is mentioned. There are 10 references: 4 Soviet, 2 Italian, 1 German, and 3 US. X

USSR/Geology - Earth's Crust

"Certain General Laws Governing the Development of the Earth's Crust,"

Iz Ak Nauk SSSR, Ser Geol, No 5, pp 22-30

States that the primary sial platforms, relics of which are preserved under the Pacific Ocean, are the original tectonic structures of the earth's crust. Since the beginning of the Archeozoic era, the tectonic conditions of the initial sial crust have been the same as the development of the modern "crustal" sial layer. The process of the development of the crustal development is characterized by the evolution of tectonic stages - stages of development of sial platforms, which are geosynclinally expressed at present in the form of sialic masses. The general direction of the tectonic process since the beginning of the Archeozoic era and up to present is expressed in the shrinkage of the sialic masses.

PAVLOVSKIY, YE. V.

The Lower Paleozoic of Prisayan'ye (Near Sayan)

The author has established in the Uda River basin the following profile of lower paleozoic deposits (from bottom to top): sandy-conglomerate (Motsk) strata; exuberant stratum lying on the Motsk; Uda strata lying on the exuberant stratum perfectly conformable; Aysinsk strata lying on the Uda strata. (RZhGeol, No. 5, 1955) Tr. Vost.-Sib. fil. AN SSSR, ser. geol., No. 1, 1954, 18-38.

Organic residues in metamorphosed complexes

Periodical : Izv. AN SSSR. Ser. geolog. 6, 15-29, Nov-Dec 1954

Abstract : Announcements are made about the discovery of well-preserved organic residues in metamorphous complexes of Siberia and Ural which deserve special attention by the stratigraphers, paleontologists and petrographers interested in metamorphic phenomena. These discoveries, according to the authors, should bring in serious corrections into many customary ideas which were previously undisputed. Offering a brief review of many interesting and often new facts the authors present only the most evident and convincing examples of the preservation of organic residues in sedimentary rocks of various eras which experiences various degrees of metamorphism. **TITLE:** The Second Session of the International Association for the Study of Plutonic Zones of the Earth's Crust in Scotland (II sessiya mezhdunarodnoy assotsiatsii po izucheniyu glubinnikh zon zemnoy kory v Shotlandii)

**PERIODICAL:** Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1958, # 1, pp 111-112 (USSR)

**ABSTRACT:** The second session of the International Association for the study of plutonic zones of the earth was held at Edinburgh on September 12, 1957. The USSR Academy of Sciences was represented by member-correspondent L.V. Pustovalov, academician R.A. Borukayev, of the Kazakhstan Academy of Sciences, doctor of geologic-mineral sciences Ye.V. Pavlovskiy (Geological Institute of the USSR Academy of Sciences) and secretary N.V. Khabarin. The leader of the Soviet delegation, R.A. Borukayev was elected president of the convention. The members of the convention had the opportunity to study the ancient geologic formations of Scotland at the occasion of several excursions. It was decided to hold the

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1958, Nr 6, pp 23-47 (USSR)

ABSTRACT: This is the first part of an article titled "Peculiarities in the Development of Caledonites in Scotland"; The second part will be published in the next issue of this periodical. A detailed description of the most ancient formations of the Scottish Highlands is given. The Soviet delegation at the 2nd session of the Association for the Study of the Earth's Crust, held in September 1957, included the following scientists: Member-Correspondent of the AS USSR, L.V. Pustovalov (Head of the delegation). Academician of the Kazakh AS SSR, P.A. Borukayev, and the author of this article. There is 1 table, 5 figures, and 40 references, of which 5 are Soviet and 35 English.

zon zemnoy kory)

**PERIODICAL:**

Vestnik Akademii nauk SSSR, 1959, Nr 2, p 79 (USSR)

**ABSTRACT:**

The Meeting was held in France between September 16 and  
September 26, 1958. Scientists from the following countries  
took part: Australia, Algeria, Belgium, the Belgian Congo,  
the Netherlands, Madagascar, the Soviet Union, France and  
Switzerland. Academician A. A. Polkanov, head of the Soviet  
delegation was unanimously elected chairman of the Meeting.  
He reported on the geology of isotopes. L. V. Pustovalov  
showed a film on the previous Meeting of the Association  
which took place in Scotland. It was decided to hold the 4th  
Meeting in 1959 in the German Federal Republic. The Soviet

PURPOSE: This book is intended for geologists and petrographers,  
particularly those interested in the worldwide distribution of  
minerals and the reasons underlying their occurrence.

Card 1/6

Mineral Deposits (Cont.)

SOV/1923

**COVERAGE:** On the basis of particular regional studies this book attempts to establish the rules governing the distribution of metallic and non-metallic ore deposits. The work includes articles on the metallogeny of individual minerals, on broad methodological problems, and on the possibility of predicting the occurrence of a mineral in the USSR on the basis of its occurrence throughout the world. Six maps depicting the distribution of a particular mineral throughout the world are included with the work. References accompany each article.

TITLE: Amplifying properties of parametric amplifiers with active devices

SOURCE: Polska akademia nauk. Bulletin, Serie des sciences techniques, v. 14, no. 9, 1966, 919-926

TOPIC TAGS: electronic circuit, electronic amplifier, frequency band, effective power gain, parametric amplifier

ABSTRACT: The paper presents the results of an approximate analysis of the amplifying properties of two-thermal parametric amplifiers with electron tubes. Formulas determining the effective power gain, the bandwidth of amplified frequencies, and ample stability conditions are given. Also, results of experiments, which agree with theoretical conclusions, are furnished. The paper was presented by Professor A. K. Smolinski, 1 April 1966. The author thanks Professor W. Goide,

Orig Pub : Nauchn. zap. Belotserkovsk. s.-kh. in-t, 1957, 6, 117-124.

Abstract : The inspection of 6 farms suspect of infectious rhinitis (IR) revealed that the source of infection was to be looked for in the supernumerary sick pigs from which the disease spread by contact to the suckling pigs, and less often to the weanlings. In the case of weanlings, the clinical symptoms of disease appeared later (by 7-8 months of age). In the early stages of IR, morphological and biological changes of the blood were not observed.

S/0208/64/004/001/0178/0183

AUTHOR: Pavlovskiy, Yu. N. (Moscow)

TITLE: Numerical computation of plane laminar boundary layer in compressible gas on a blunt plate

SOURCE: Zhurnal vy\*chisl. matem. i matem. fiz., v. 4, no. 1, 1964, 178-183

TOPIC TAGS: boundary layer, plane layer, laminar boundary layer, compressible gas, blunt plate, integral relation, fifth approximation

ABSTRACT: The author continues previous work (Chislenny\*ye raeschet laminarnogo pogranchnogo sloya v szhimayemom gaze. Zh. vy\*chisl. matem. i matem. fiz., 1962, 2, No. 5, 884-901) where he proposed a method for numerical solution of the equations of a laminar boundary layer in a compressible gas, based on the use of integral relations, and which is a generalization of the method for an incompressible gas. In the cited paper he also gave the results of computation of a compressible laminar plane boundary layer on a cylinder with a plate (Fig. 1. in the Enclosure) for the case where  $M_{\infty} = 4$ ,  $Pr = 3/4$ ,  $T_0 = 1000$  under the condition  $(\partial T / \partial y)_{y=0} = 0$  (non-heat-conductive body) obtained via numerical integration of systems of second, third, and fourth approximations. In the present paper the

Card 73

ACCESSION NR: AP4012013

author gives the results of computation of a compressible boundary layer in this same case. These results are obtained by integrating a system of fifth approximation. He also gives the results for a boundary layer, when the body radiates, i.e., the boundary condition on the body for temperature has the form

$$\left(\lambda \frac{\partial T}{\partial y}\right)_{y=0} = \epsilon \sigma (T)_{y=0}^4 - T_{\infty}^4. \quad (1)$$

where  $T_{\infty}$  is the static temperature in the inflow. The notation and terminology are those of the author's previous work. "The author is grateful to A. A. Dorodnitsyn who was very helpful in the completion of this work, and also to N. N. Moiseyev and P. I. Chushkin for their valuable advice." Orig. art. has: 5 figures and 8 formulas.

S/044/62/000/006/040/127  
B156/B112

AUTHOR: Pavlovskiy, Yu. N.

TITLE: Investigation of certain invariant solutions to boundary layer equations

PERIODICAL: Referativnyy zhurnal. Matematika, no. 6, 1962, 65, abstract 6B349 (Zh. vychisl. matem. i matem. fiz., v. 1, no. 2, 1961, 280-294)

TEXT: Certain results, associated with the investigation of the group properties of the system of equations

$$w_y = \frac{1}{v} (u u_x + v w + \frac{1}{p} p_x), p_y = 0, v_y + u_x = 0, \\ u_y - w = 0, \quad (1)$$

are deduced. The local Lie group G of transformations of the space  $E_6$  (points which have coordinates u, v, w, p, x and y) is called the Card  $1/4$

Investigation of certain invariant ...

S/044/62/050/0 2/040/127  
B156/B112

principal group of system (1), provided that: (a) the  $G$  transformations translate any solution of (1) into a solution of (1), and (b) any single-parameter Lie group of transformations of the space  $E_6$  having the

property (a) belongs to  $G$ . The coordinates of the infinitesimal operators governing the single-parameter sub-groups in group  $G$  prove to be independent of  $w$ , and examination is therefore conducted in the space  $E_5$  with coordinates  $u, v, p, x$  and  $y$ . In the case under consideration, the general solution to the fundamental equations of Lie's algebra depends on four arbitrary constants and one arbitrary function. Accordingly,  $G$  is the product of a four-parameter group generated by the operators

$$X_1 = x \frac{\partial}{\partial x} + u \frac{\partial}{\partial u} + 2p \frac{\partial}{\partial p},$$

$$X_2 = y \frac{\partial}{\partial y} - 2u \frac{\partial}{\partial u} - v \frac{\partial}{\partial v} - 4p \frac{\partial}{\partial p},$$

$$X_3 = \frac{\partial}{\partial x}, \quad X_4 = \frac{\partial}{\partial p},$$

and the  $n$ -dimensional group generated by the operator  $X_5 = f(x) \frac{\partial}{\partial y} + g(x) \frac{\partial}{\partial v}$

with the arbitrary function  $\varphi(x)$ . The solution

$$u = u(x,y), v = v(x,y), p = p(x,y) \quad (2)$$

to system (1) is called an invariant solution, or a solution set up on the sub-group HCG if the manifold (2) in  $E_5$  is invariant relative to H.

The two solutions (2) are said to be substantially different if there is no transformation from G translating one into the other. If the reverse is true, the solutions are called similar. The article contains all the substantially different invariant solutions of (1), set up in single-parameter sub-groups of the main group. It is sufficient to examine the sub-groups  $H_1, H_2, \dots, H_9$  with infinitesimal operators

$$X_1 + aX_2, X_2, X_3, X_4, X_2 + X_3, X_3 + X_4, \\ 2X_1 + X_2 + X_4, X_5, X_4 + X_5$$

respectively, since each two solutions set up on two different sub-groups of the number indicated are substantially different, and any solution to

(1) set up on any single-parameter sub-group of  $G$  is similar to the solution set up on some sub-group  $H_1$ . All the invariant solutions correspondent to the sub-groups indicated are written out, and the solution generated by the sub-group  $H_1$  is discussed in detail. is equivalent to the integral relations

$$\frac{d}{ds} \int_0^1 \Theta (1-z) f(z) dz = -\beta \int_0^1 \Theta f'(z) z (2-z) dz + \beta \int_0^1 \omega f'(z) dz + \frac{f'(1) b_0}{\Theta_0} - \int_0^1 \frac{b}{\Theta} f'' dz, \tag{2.14}$$

$$\frac{d}{ds} \int_0^1 \omega (1-z) f(z) dz = -\beta \int_0^1 \omega f'(z) z (2-z) dz + \beta \int_0^1 \frac{\omega^2}{\Theta} f'(z) dz + \frac{\omega_0 b_0}{\Theta_0^2} f'(1) - \int_0^1 \frac{b \omega}{\Theta^2} f''(z) dz + \left(\frac{1}{Pr} + 1\right) \int_0^1 q f'(z) dz - \frac{q_0 f(1)}{Pr} + 2\alpha_e \left(\frac{1}{Pr} - 1\right) \int_0^1 \frac{b}{\Theta} (1-z) f'(z) dz. \tag{2.15}$$

Substitution of  $f(z)$  by powers of  $z$  yields a system of  $2n - 1$  integral relations. Approximate expressions for  $\Theta$  and  $\omega$  are inserted in these relations, resulting in the following system of ordinary differential

AUTHOR: Pavlovskiy, Yu. N. (Moscow)  
TITLE: Investigation of some invariant solutions of the equations of the boundary layer  
PERIODICAL: Arhivum Mehaniki Stosovanej, v. 14, no. 3-4, 1962, 401-404

TEXT: The article is a summary of a work published in Zhurnal Vychislitel'noy matematiki i Matematicheskoy Fiziki, v. 1, no. 2, (1961), and gives some results connected with the group properties of boundary layers for two-dimensional incompressible flows, based on the method of L. S. Ovsyannikov. The fundamental group of the system is determined as the product of a four-parameter group and an infinite group. By integrating a system of ordinary differential equations the invariant first-rank solutions, including, in particular, the self-similar solutions, are obtained. Solutions corresponding to the one-parameter subgroup  $X = X_1 + X_2/(m + 2)$  are considered in detail. Hence, solutions are obtained in which the

interaction of the boundary layer and the perfect flow are taken into account, and for the cases when the perfect flow is characterized by  $p = \text{const}$ ,  $v = 0$  and  $u_1 = ay^m$  ( $c = 0$ ) or  $u_1 = x^m (m + 2) + ay^m$  ( $c \neq 0$ ) in the usual notation. The asymptotic behavior of such solutions is considered. A method is also given for improving in some sense the formulation of the boundary layer problem for the flow past any solid, which consists of a change of the thickness of the solid by an amount  $\delta^*(x)$  corresponding to the transformation of the solution of the boundary layer problem by a finite transformation of a subgroup, generated by the operator which generates the infinite group mentioned above.
